Demographic Controls

Table S1

H1 Main Effect with Demographic Controls

Variable	g(b)	*SE*	*t*	*df*	*p*	95% CI
intrcpt	0.57	0.23	2.45	6.98	.044*	[0.02, 1.12]
male.ratio	-0.70	0.54	-1.29	1.91	.330	[-3.15, 1.74]
Age	0.00	0.18	0.02	2.27	.984	[-0.68, 0.69]

Note. The intercept represents the estimated effect size at the mean age and balanced gender. Age in this model was standardised. CR2 correction was applied for this four-level model.

Table S2

H2 Main Effect with Demographic Controls

Moderator	*g*	se	*t*	*df*	*p*	95% CI
intrcpt	-0.26	0.04	-6.50	14	< .001***	[-0.35, -0.18]
male.ratio	0.14	0.24	0.58	14	.574	[-0.37, 0.64]
Age	-0.01	0.03	-0.51	14	.617	[-0.07, 0.05]

Note. The intercept represents the estimated effect size at the mean age and balanced gender. Age in this model was standardised. We used the Knapp-Hartung method for this one-level model.

Table S3

H5 Main Effect with Demographic Controls

Variable	g(b)	*SE*	*t*	*df*	*p*	95% CI
intrcpt	0.28	0.13	2.10	5.29	.087	[-0.06, 0.61]
male.ratio	0.10	0.37	0.26	3.35	.814	[-1.03, 1.22]
Age	-0.23	0.08	-2.73	1.83	.123	[-0.62, 0.16]

Note. The intercept represents the estimated effect size at the mean age and balanced gender. Age in this model was standardised. CR2 correction was applied for this three-level model.

Table S4

H6 Main Effect with Demographic Controls

Moderator	*g*	se	*t*	*df*	*p*	95% CI
intrcpt	0.07	0.07	0.97	10	.353	[-0.09, 0.23]
male.ratio	-0.02	0.18	-0.09	10	.932	[-0.42, 0.39]
Age	-0.01	0.13	-0.09	10	.933	[-0.31, 0.29]

Note. The intercept represents the estimated effect size at the mean age and balanced gender. Age in this model was standardised. We used the Knapp-Hartung method for this one-level model.

Moderation Analysis

Table S5

Full Results of the Single-Moderator Analysis for H1

Moderator	*g*	*SE*	*t*	*df*	*p*	95% CI

Note. All categorical variables were analysed without an intercept; therefore, the coefficients represent the effect sizes for each corresponding condition. All continuous variables were not standardised; therefore, the coefficients represent the change in effect size for a one-unit increase (e.g., one year for age, one unit for the cost ratio, and the difference between all-female and all-male participants for the male ratio).

Best-fitting Model

Model Comparison

Table S10

Model Comparison for H1

Model	*df*	BIC	LL	LRT	*p*
Four-level model	4	83.21	-33.74		
Three-level model	3	94.57	-41.39	15.295	< .001***
Two-level model	2	103.60	-47.87	28.25	< .001***

Note. BIC = Bayesian information criterion; LL = Log Likelihood; LRT = Likelihood Ratio Test.

The three-level model includes the paper level, the within-paper level (i.e. effect size level), and the participant level. The two-level model includes the effect size level and the participant level. All reduced models were compared with the full model (i.e. the four-level model). The best-fitting model is highlighted.

Table S11

Model Comparison for H2

Model	*df*	BIC	LL	LRT	*p*
Four-level model	4	-7.85	10.37		
Three-level model	3	-11.07	10.37	0	1.00
Two-level model	2	-14.29	10.37	0	1.00

Note. BIC = Bayesian information criterion; LL = Log Likelihood; LRT = Likelihood Ratio Test.

The three-level model includes the paper level, the within-paper level (i.e. effect size level), and the participant level. The two-level model includes the effect size level and the participant level. All reduced models were compared with the full model (i.e. the four-level model). The best-fitting model is highlighted.

Table S12

Model Comparison for H5

Model	*df*	BIC	LL	LRT	*p*
Four-level model	4	24.41	-5.61		
Three-level model	3	21.11	-5.61	0	1.00
Two-level model	2	25.31	-9.36	7.494	.024*

Note. BIC = Bayesian information criterion; LL = Log Likelihood; LRT = Likelihood Ratio Test.

The three-level model includes the paper level, the within-paper level (i.e. effect size level), and the participant level. The two-level model includes the effect size level and the participant level. All reduced models were compared with the full model (i.e. the four-level model). The best-fitting model is highlighted.

Table S13

Model Comparison for H6

Model	*df*	BIC	LL	LRT	*p*
Four-level model	4	1.60	5.09		
Three-level model	3	-1.34	5.09	0	1.00
Two-level model	2	-4.29	5.09	0	1.00

Note. BIC = Bayesian information criterion; LL = Log Likelihood; LRT = Likelihood Ratio Test.

The three-level model includes the paper level, the within-paper level (i.e. effect size level), and the participant level. The two-level model includes the effect size level and the participant level. All reduced models were compared with the full model (i.e. the four-level model). The best-fitting model is highlighted.

Results of Best-fitting Model
